Performance of Similarity functions

column	Performance
name	TF/IDF arguably performs the best for this column because a lot of the names involve change in orderings of the words like bel-air hotel and hotel bel-air. And because the tokenizer strips the string of its quotes and then splits the string on spaces, really good accuracy is observed. Levenshtein is an average performer. Needleman-Wunch unsurprisingly does badly because a lot of the words do not align with other words and NW has a significant gap penalty, thus the low accuracy. Smith Waterman does pretty well because it only compares substrings of the two strings that have aligned. So bel-air in bel-air hotel and hotel bel-air will align and give a perfect score.
addr	The address is tricky and in-order to get good matches they should be broken down because whole addresses are usually long and rarely will contain exact matches. Also, if the buildings numbers are common then that should hold a lot more significance as it is much more likely that they will also share the same address, thus Jaro-Winkler gets a good score because it assigns a bonus if the strings have matching prefixes(building nums). Soundex does bad because of numbers. Levenshtein and NW do bad because they don't work on substrings. TF/IDF again does pretty well because it compares tokens, so building numbers will match to the building numbers even if the addresses don't match. However since there are many tokens for each string, a match only on the building numbers may not ensure a high number.
city	Because every city in d1.csv has a perfect match in d2.csv. No significant differences in the two strings like hollywood and w. hollywood.
type	TF/IDF does well again because a lot of matches involve words like french and french (new), so such matches will obviously better TF/IDF's accuracy. All of the remaining almost perform equally well because there isn't much difference in the matches. And all fail over the same pair of strings.
